

# **Modern methods for sample preparation prior to analysis**

Ph.D. Baimatova N.

Senior scientist in "Laboratory of Ecology  
of Biosphere"

Al-Farabi Kazakh National University  
CPCMRA

# Sample preparation

- ✓ It takes 60% of the time, labor and money costs in the analysis
- ✓ Introduces additional errors

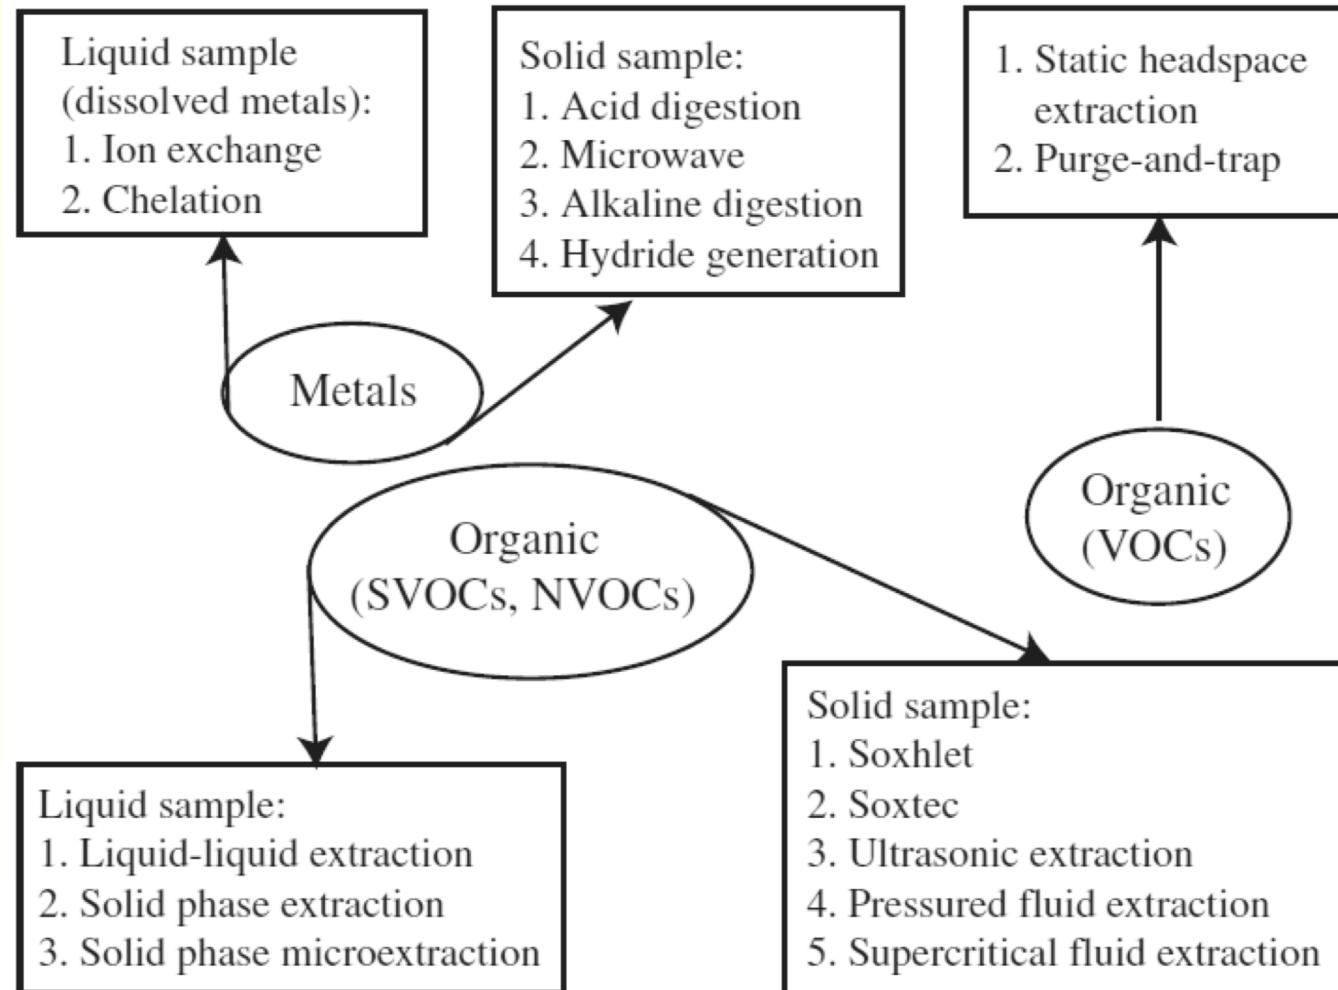

## *Purpose*

- Separate analytes from each other
- To increase concentration of analyte

# Type of sample preparation

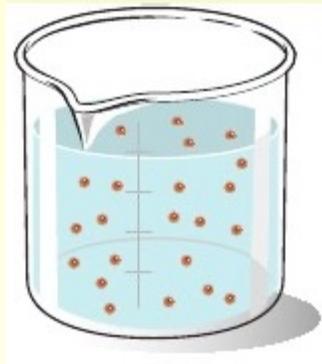

- ❖ Dilution, concentration of analyte
- ❖ Centrifugation
- ❖ Filtration
- ❖ Extraction
  - ❖ Liquid-liquid extraction
  - ❖ Solid phase extraction
  - ❖ Vapor phase extraction
  - ❖ Purge and Trap method
  - ❖ Solid phase microextraction

# Selection of method

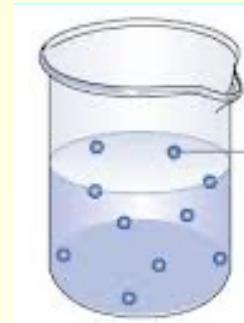

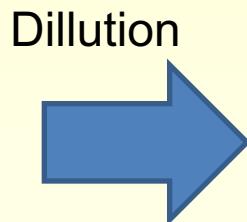

# Types of sample preparation

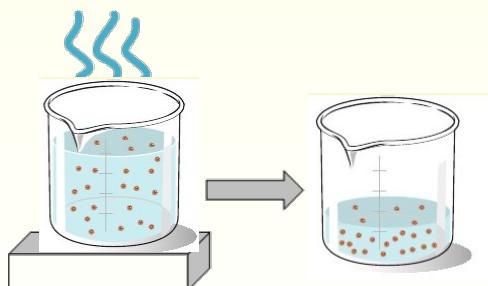

❖ Dilution, concentration of sample

Concentration

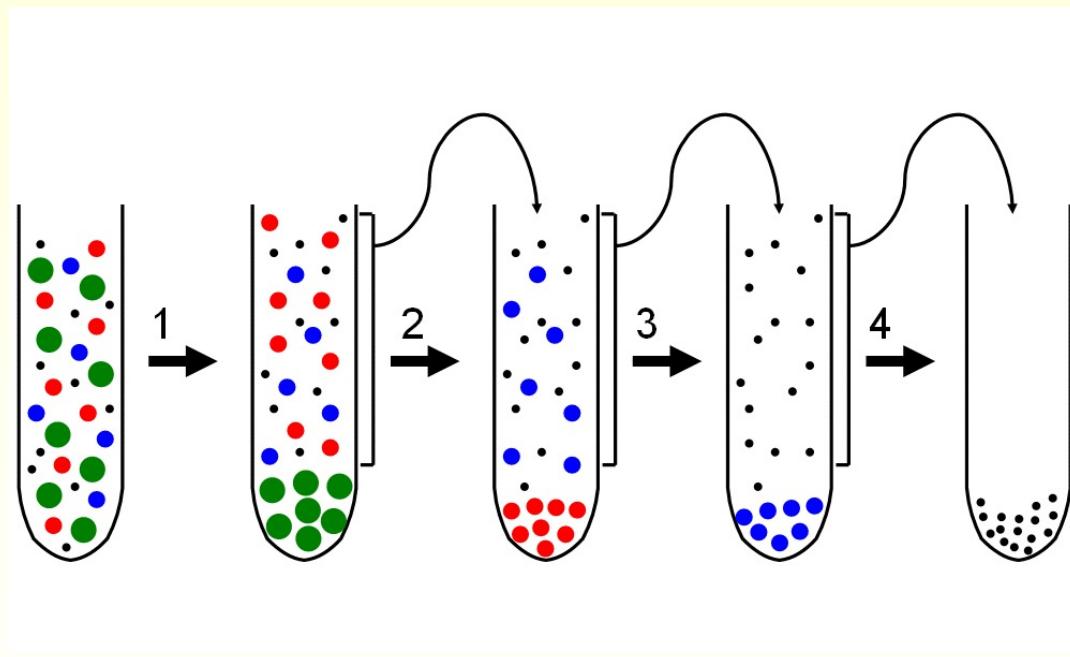

$$C_1 V_1 = C_2 V_2$$

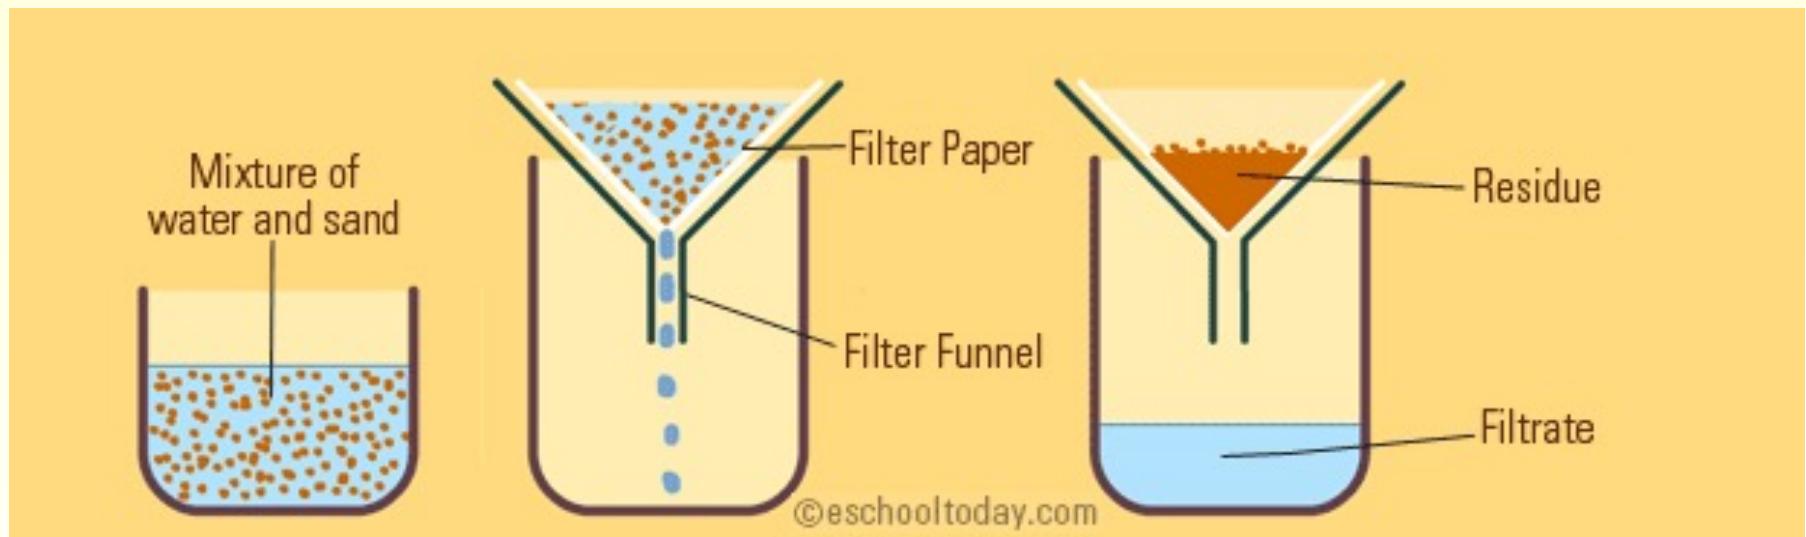

# Types of sample preparation

## ❖ Centrifugation

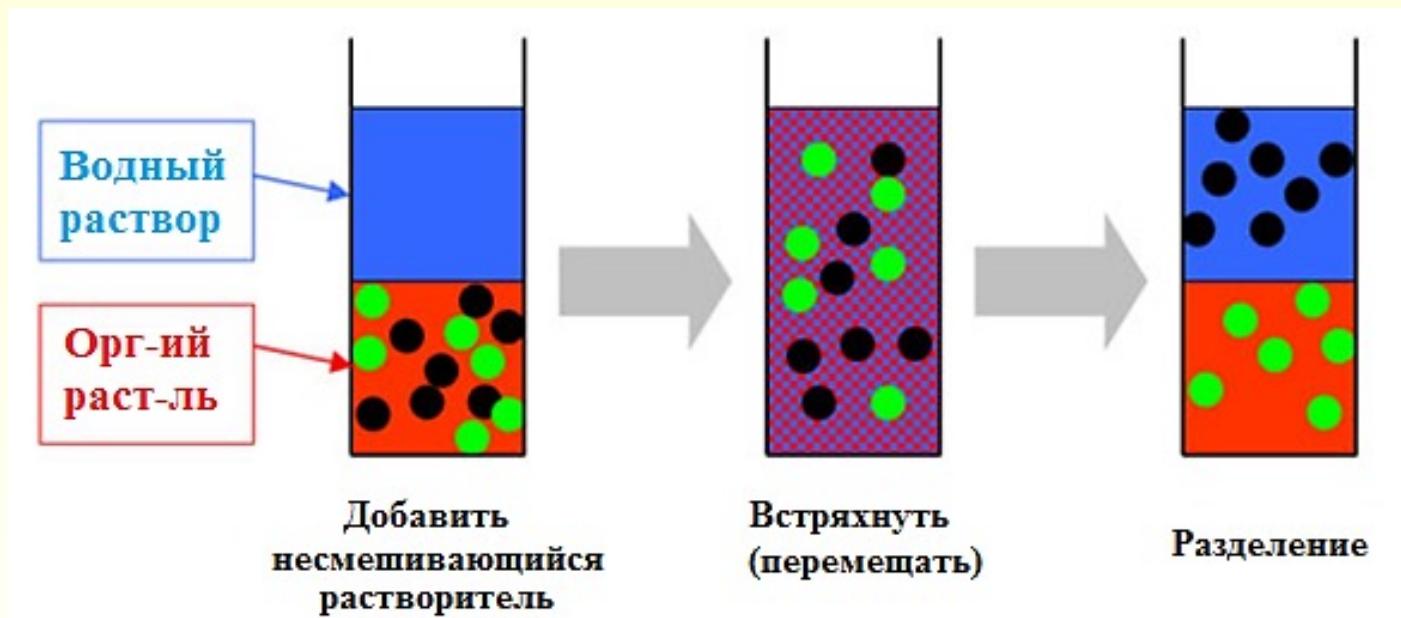

# Types of sample preparation

## ❖ Filtration

# Liquid-liquid extraction

A method of separating and concentrating substances based on their different distribution between two immiscible liquid phases, usually between water and an immiscible organic solvent

● **органические соединения**

● **примеси**

# Liquid-liquid extraction

- A common type of sample preparation
- For non-volatile organic compounds
- The division of the sample between two miscible phases
- The extraction efficiency depends on the solubility of immiscible solvents

# Theory

Distribution coefficient

$$K_D = \frac{[A]_{\text{org}}}{[A]_{\text{aq}}}$$

$[A]_{\text{org}}$  – equilibrium concentrations of compounds in the organic phase;

$[A]_{\text{aq}}$  – equilibrium concentrations of compounds in the aqueous phase

# How to choose a solvent

- Immiscible with water
- Relatively low boiling point
- High solubility of organic compounds
- Non-toxic, affordable, inexpensive

# Typical solvents in L/L extraction

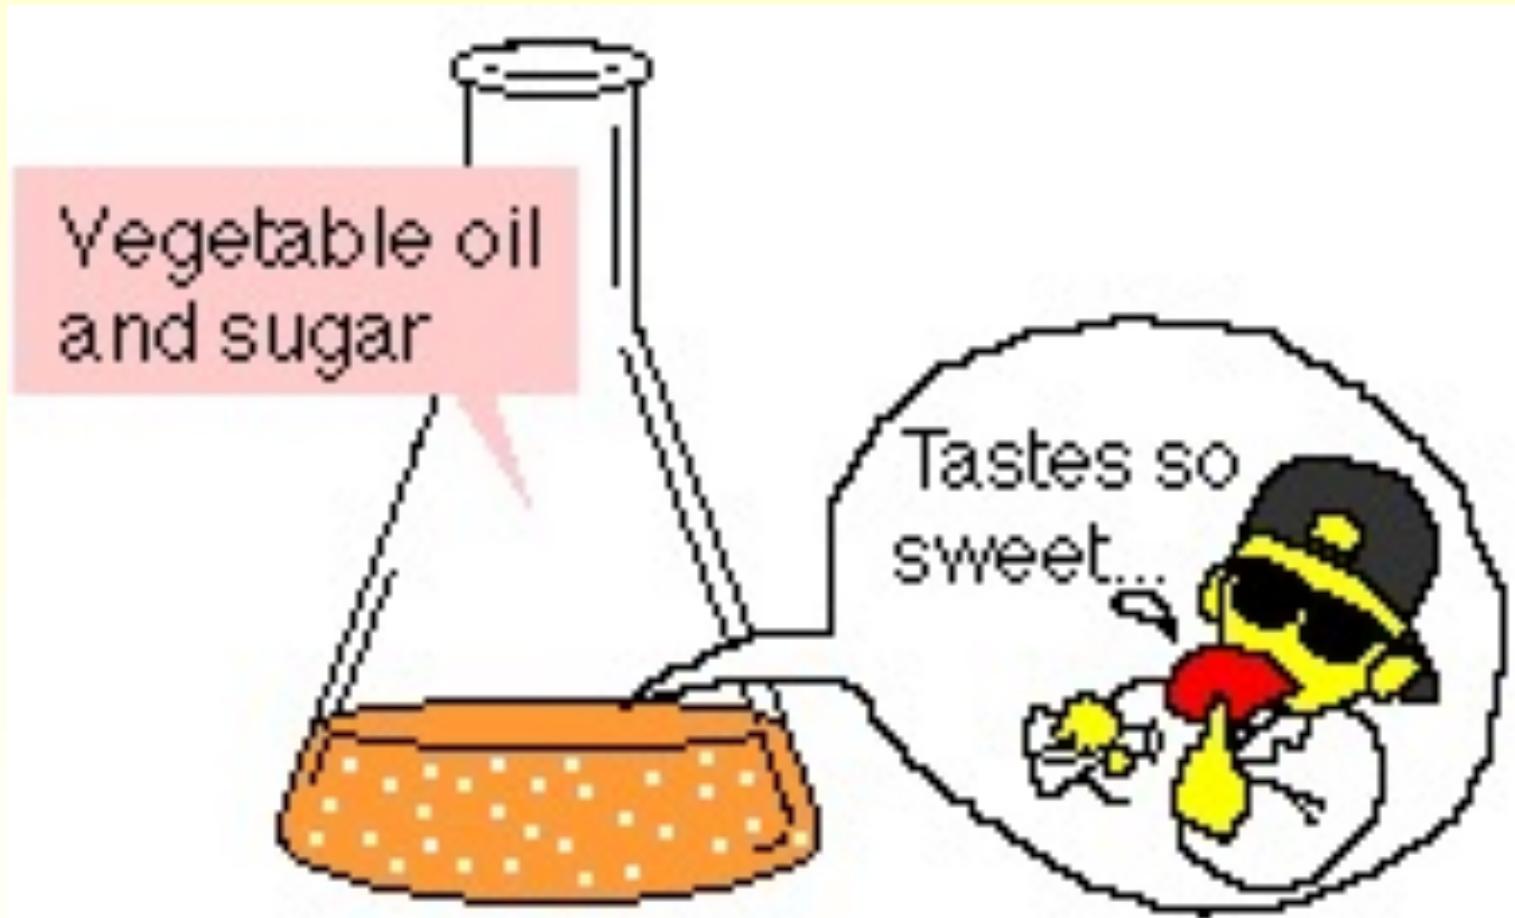

## □ Aqueous solvents

- Clean water
- Acid solution
- Alkaline solution
- The combination of solutions

## □ Organic solvent

- Diethyl ether
- Methylene chloride
- Chloroform
- Ethyl acetate
- Toluene and xylenes
- Aliphatic ketones

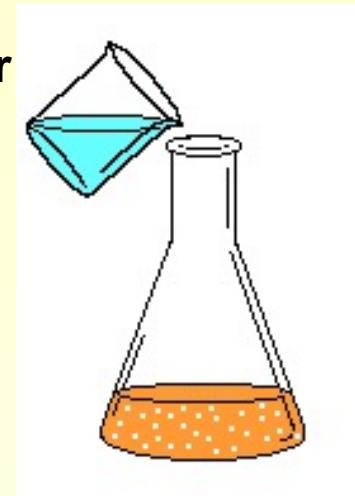

# Example

**Sugar is more soluble in water than in oil.**

**Water does not mix (dissolve) with oil**

**Water**

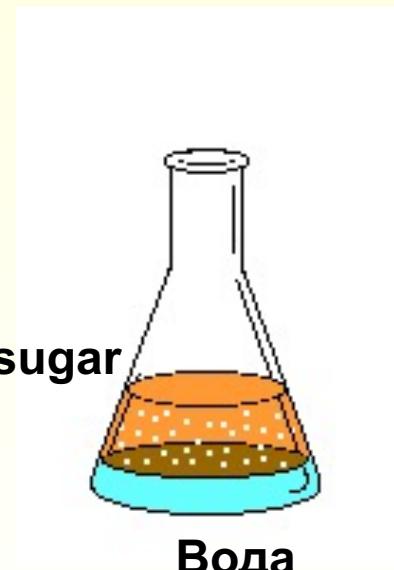

**Aqueous phase the lower layer**

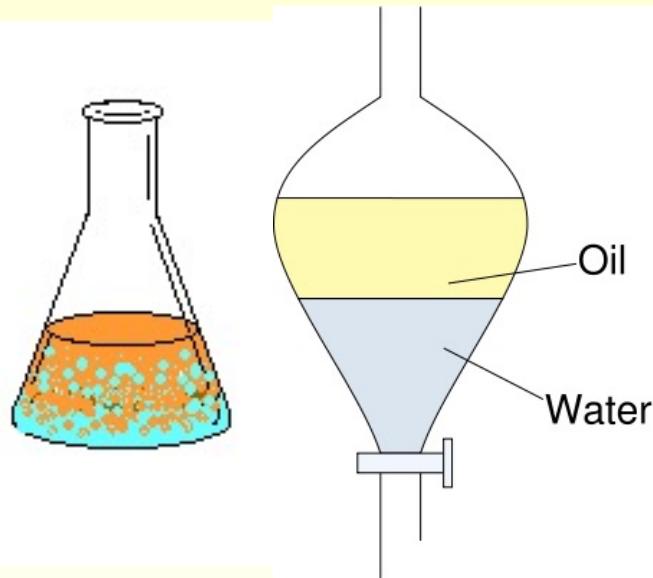

**The oil phase is the upper**

**Oil and sugar**

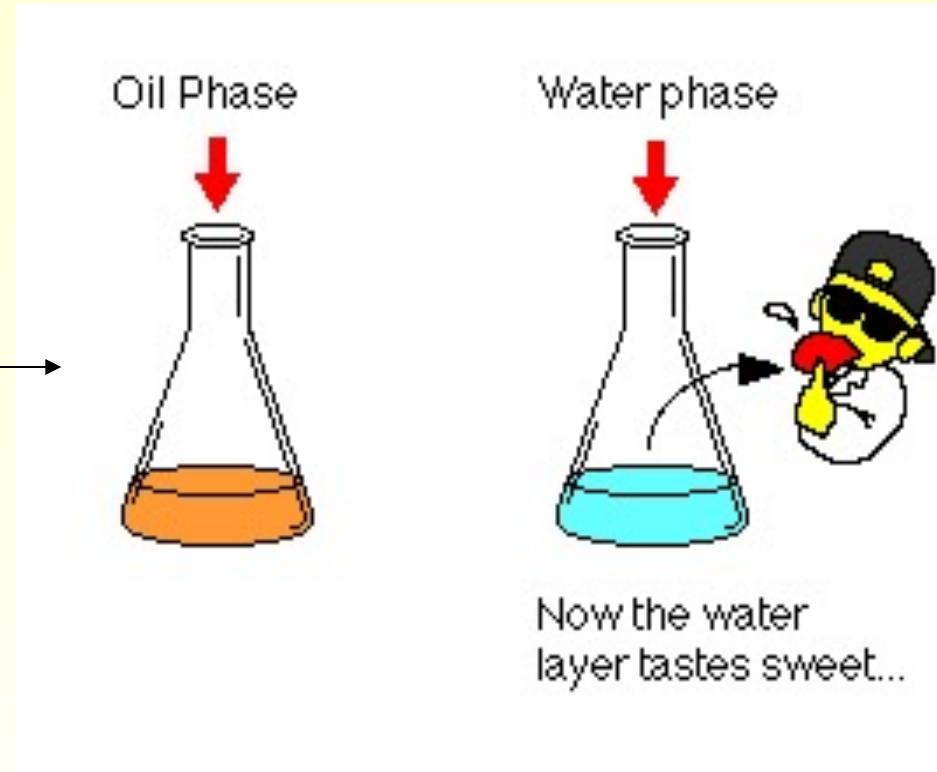

**Вода**

# Extraction of sugar from oil with water

**Water + Oil + sugar**

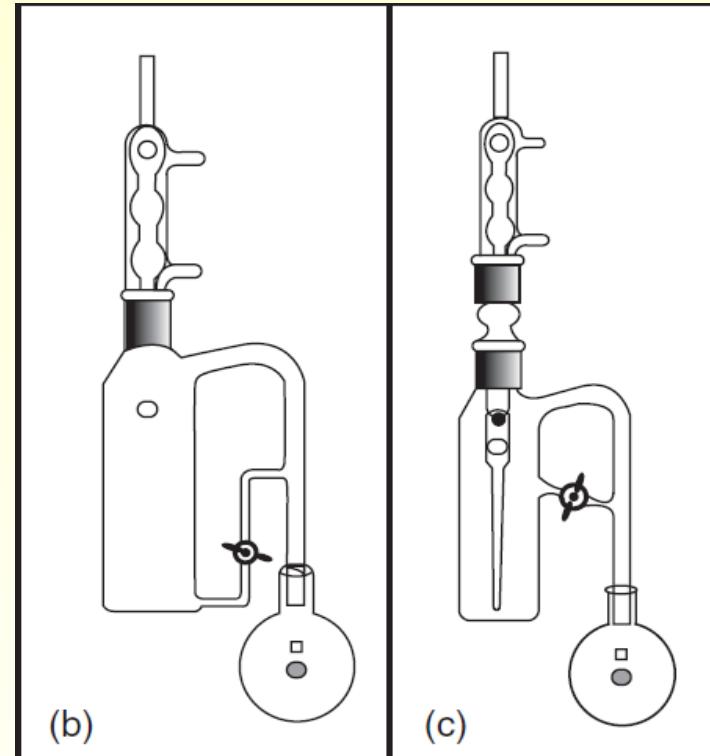

Now the water  
layer tastes sweet...

# Devices for L/L extraction

**Separating funnel**

**Continuous extractor designed for heavier/lighter water solvents**

# Increasing the efficiency of L/L extraction

- Addition of salt
- pH
- Proper choice of solvent
- Sequential extraction (several portions of extractant for procedure)

# The advantages of the L/L extraction

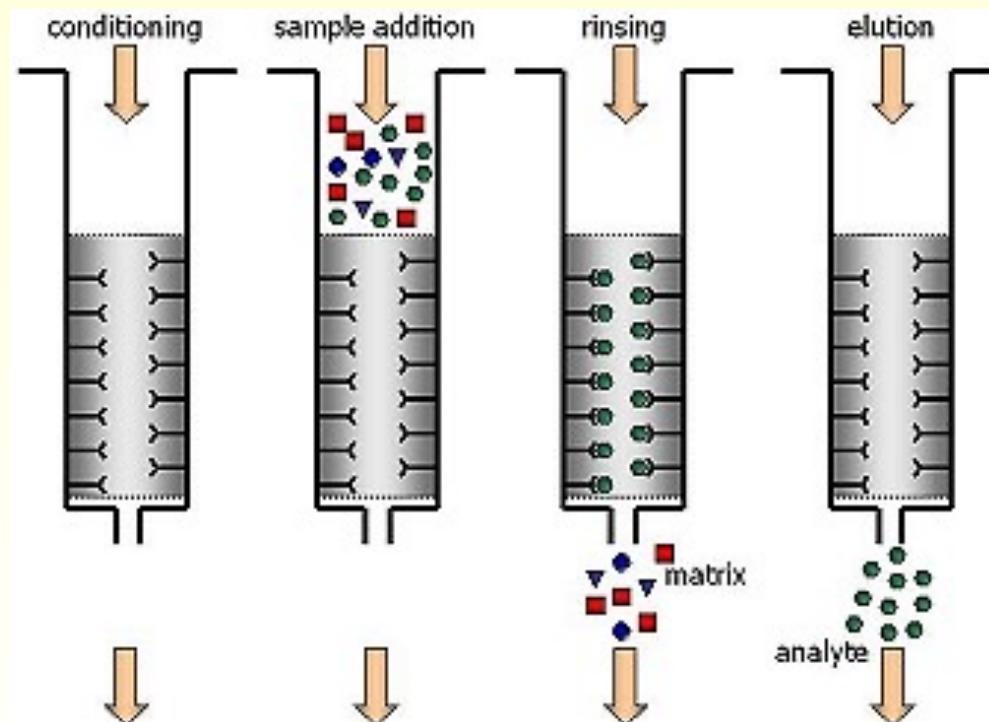

- 😊 Quick and easy
- 😊 Relatively low solvent use in the extraction of hydrophobic compounds
- 😊 High extraction efficiency for analytes with low  $K_d$  using sequential or continuous extraction

# Disadvantages of the L/L extraction

- 😊 Loss of volatile compounds
- 😊 Difficult to achieve 100% extraction efficiency
- 😊 Use and disposal of more toxic organic solvents
- 😊 Emulsion formation (difficulty in separating emulsions)
- 😊 Bulky glass equipment
- 😊 Laborious process, difficult to automate
- 😊 Pre-concentration of the sample is often required

# Solid-phase extraction (SPE)

A rapid sample preparation method in which a sorbent is used to concentrate and separate the target component or components followed by elution (washout) with a suitable solvent

# Main objectives (SPE)

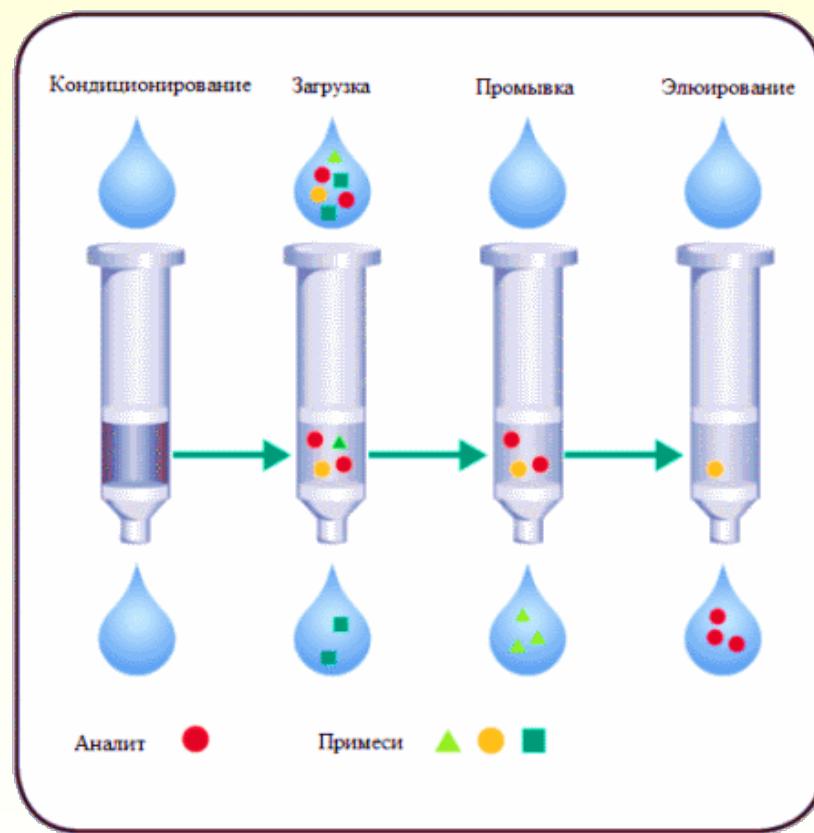

- purification of the sample from undesirable impurities
- concentration of sample components
- transfer of sample components to another matrix.

# The main stages of SPE

- Conditioning
- Equilibration
- The sample application
- Washing
- Eluting

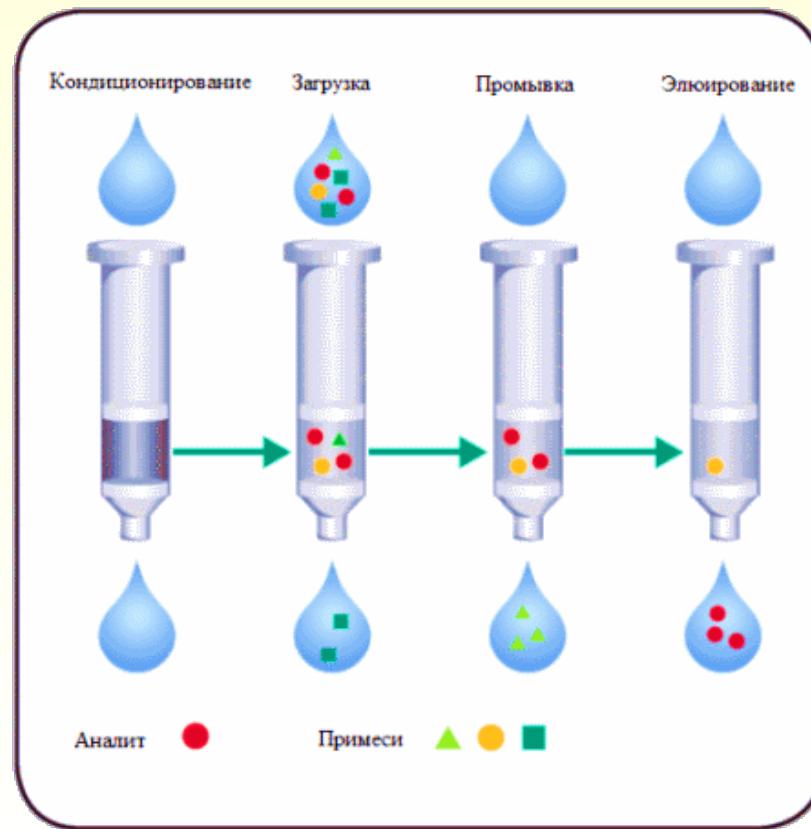

# Conditioning

SPE is performed using the cartridges filled with a dry sorbent. Conditioning is required to activate the sorbent.

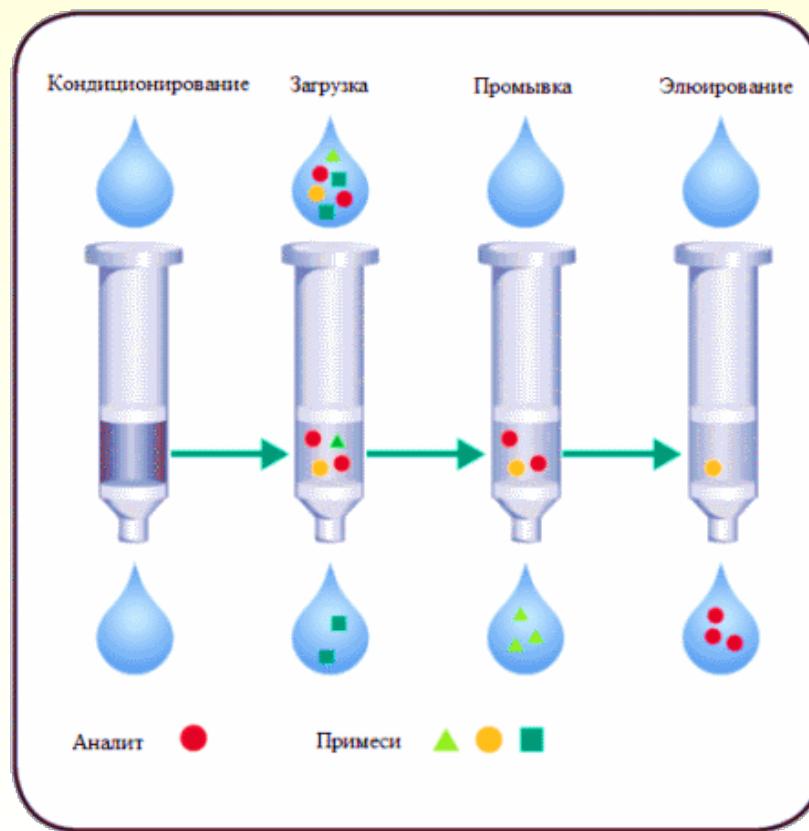

# Loading of sample

The aim is to quantitatively retain the analyte on the SPE cartridge while the matrix impurities are removed. The sample is introduced into the SPE column and it passes through the sorbent.

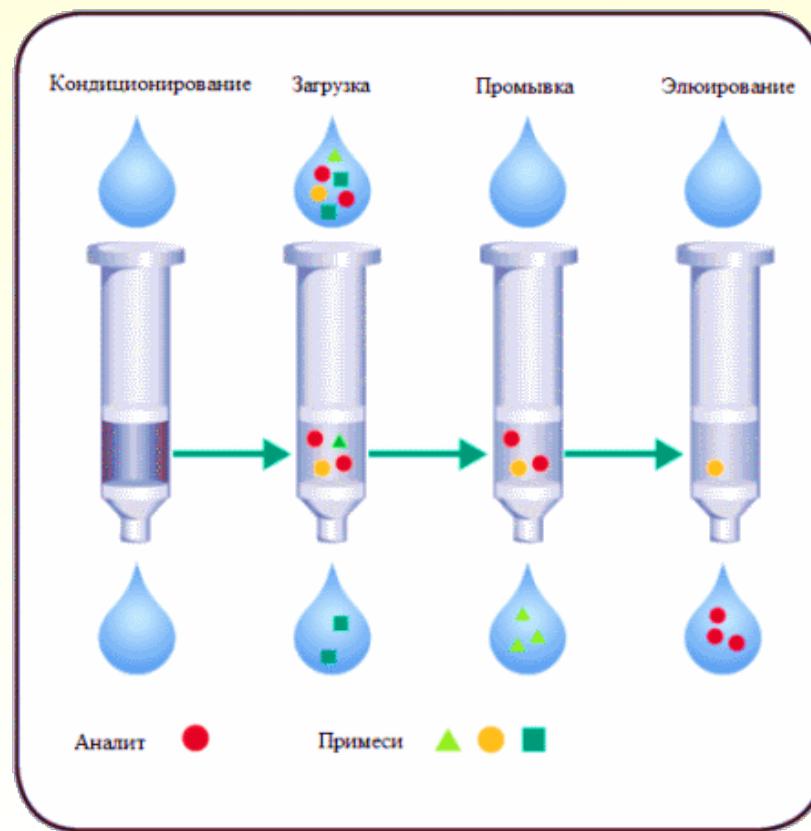

# Washing

After the analyzed substance(s) is retained by the sorbent, the sorbent is washed from impurities.

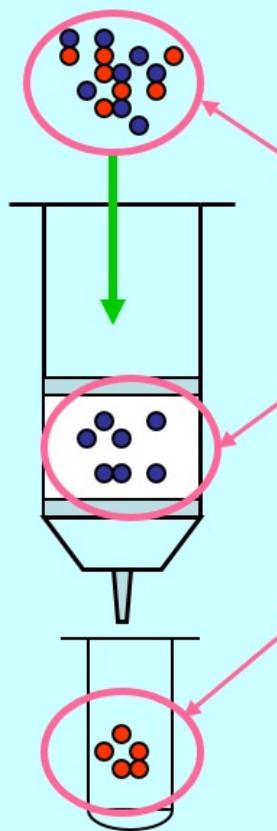

# Eluting

Quantitative elution of the analyte. This can be done in one or more steps to collect different analytes into different test tubes.

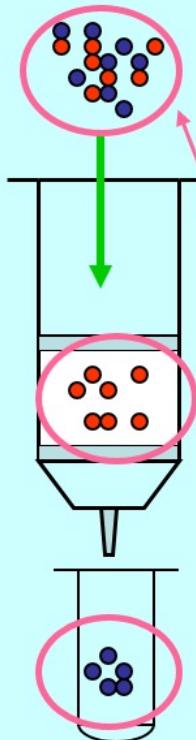

Все методы ТФЭ по принципу удерживания следует разделять на два типа: **удерживающая** и **неудерживающая** твердофазная экстракция

При неудерживающей твердофазной экстракции целевой компонент с примесями наносится на подготовленную ТФЭ-колонку. После этого, в процессе элюирования на сорбенте удерживается часть примесей, а целевой анализируемый компонент отправляется в емкость для сбора экстракта.

- целевой компонент
- примеси

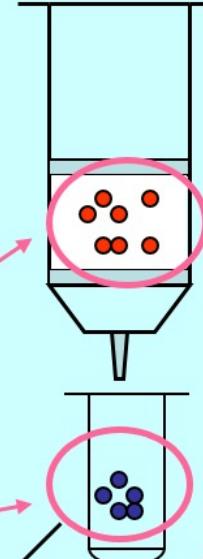

При удерживающей  
твердофазной  
экстракции целевой  
компонент с примесями

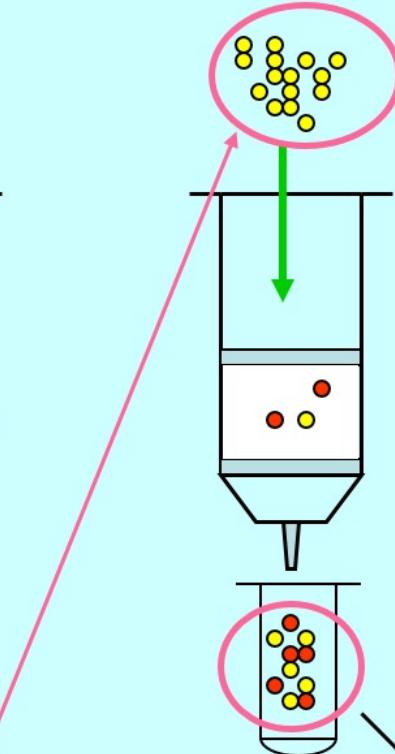

1) наносится на  
подготовленную ТФЭ-  
колонку

2) целевой компонент  
удерживается на  
сорбенте, а часть  
примесей вымывается

3) затем он элюируется  
соответствующим  
растворителем

в слив

для дальнейшего анализа

- целевой компонент
- элюирующий растворитель
- примеси

# Advantages of SPE in comparison with L/L extraction

- Selectivity and specificity
- A better separation
- High quantitative recovery of the test sample(> 75%)
- Excellent reproducibility
- Ease of handling
- Possibility of optimization
- Savings of expensive solvents

## Vapor phase extraction

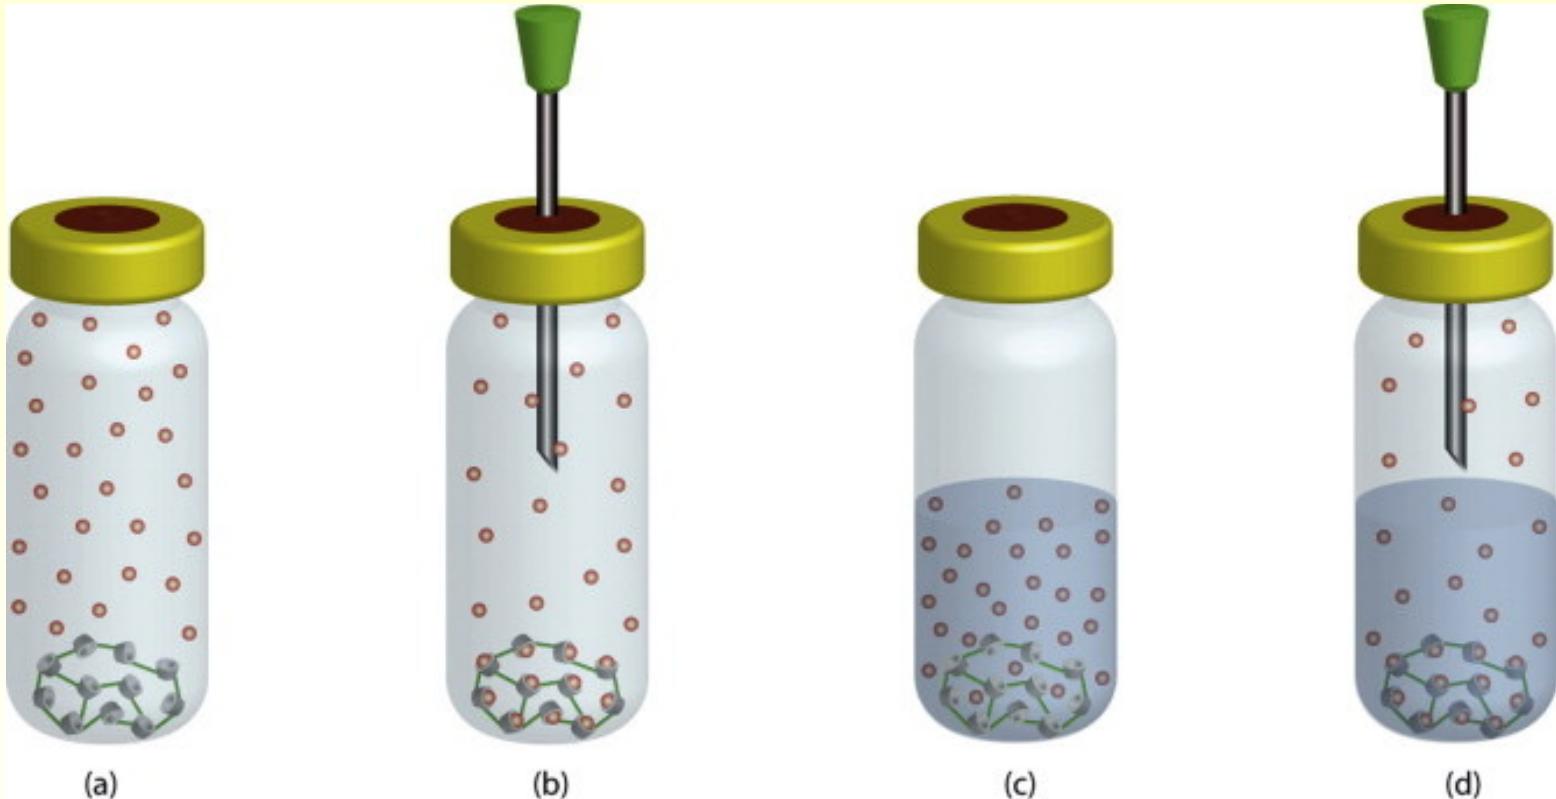

Static

Dynamic

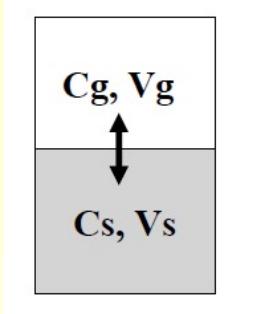

Headspace  
extraction

Purge and trap method

# Headspace extraction

# Headspace extraction

Distribution coefficient ( $K$ ) =  $C_s/C_g$

Phase ratio ( $\beta$ ) =  $V_g/V_s$

$C_s$ = analyte concentration in the sample

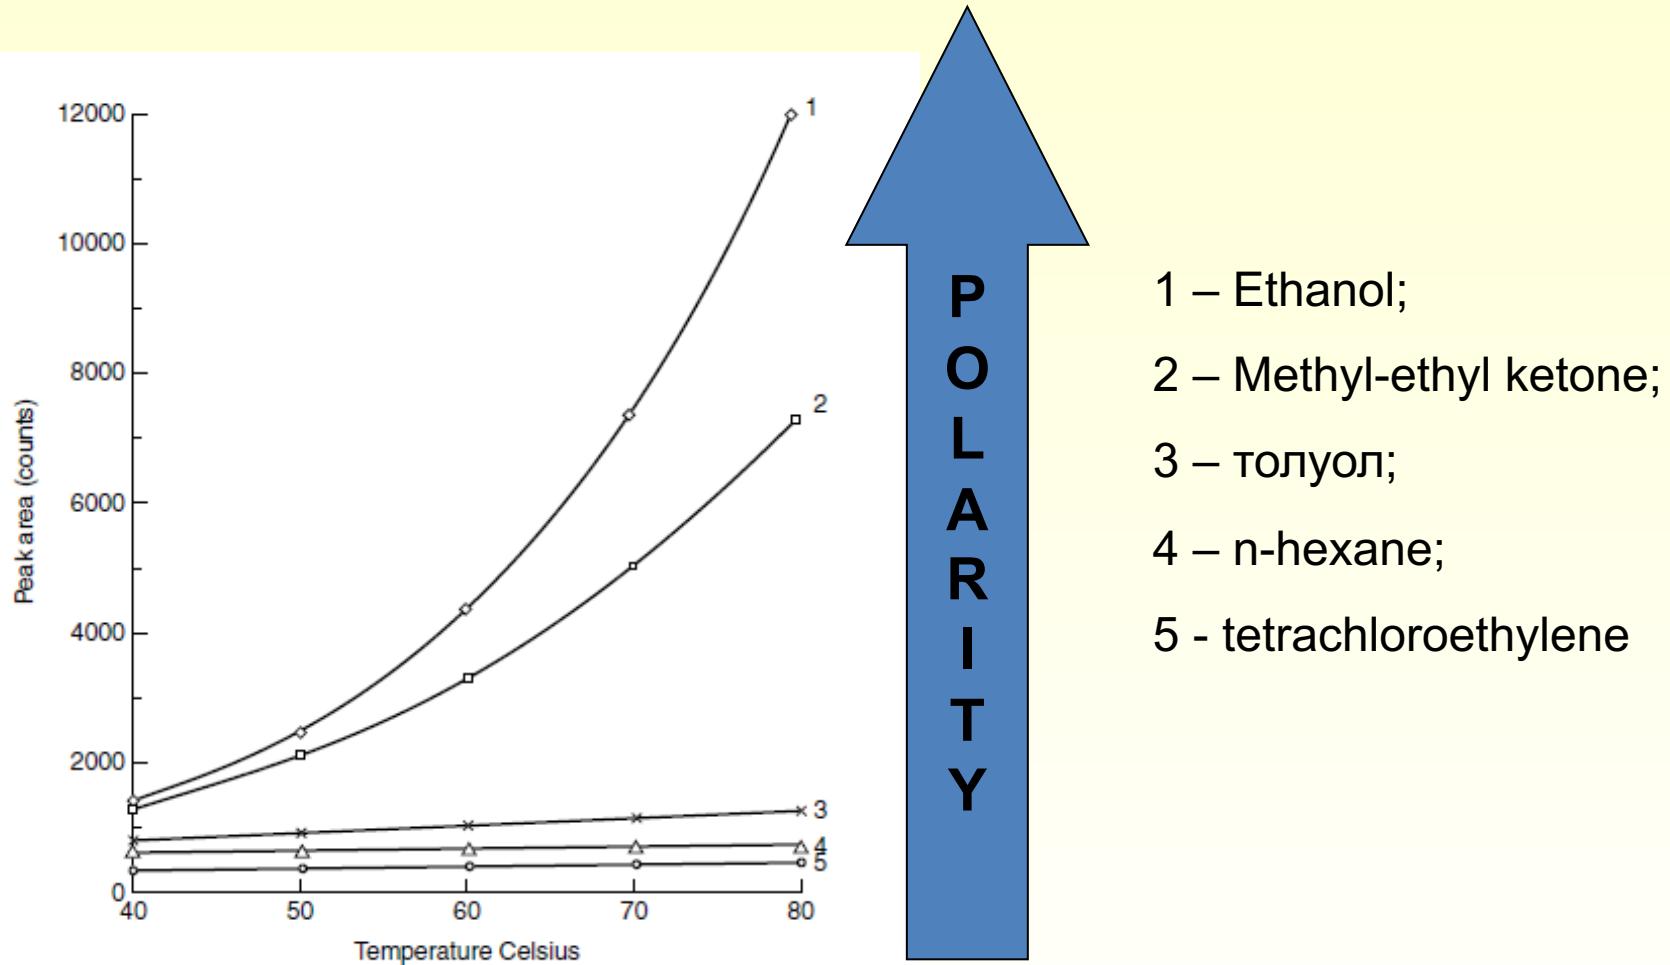

$C_g$ = analyte concentration in the sample

$V_s$ = sample volume

$V_g$ = the volume of the gas phase

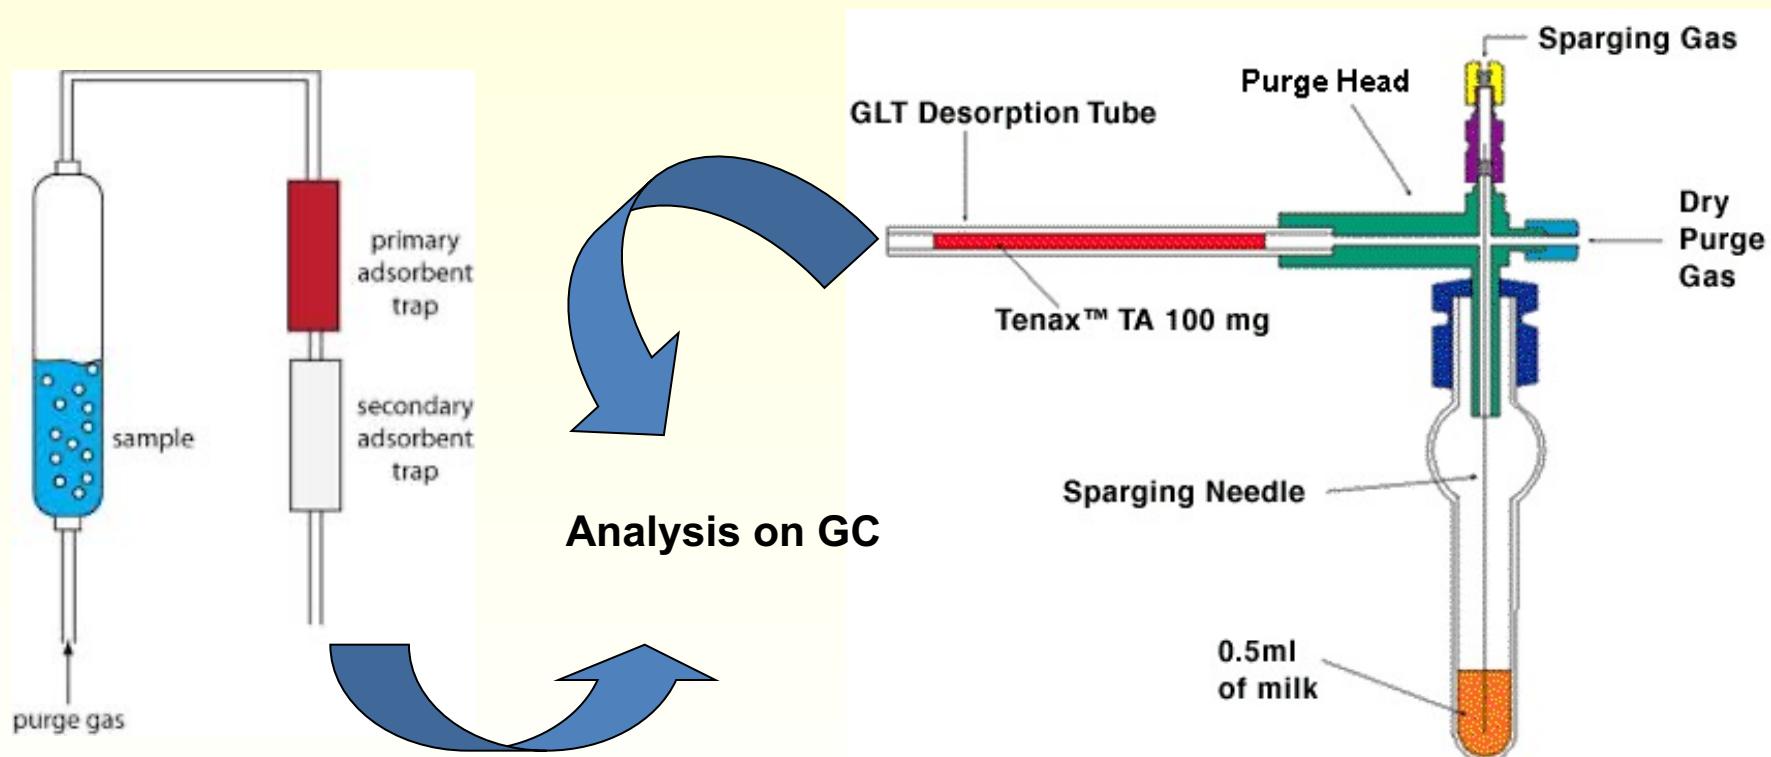

$$C_g = \frac{C_o}{K + \beta}$$

# Temperature influence

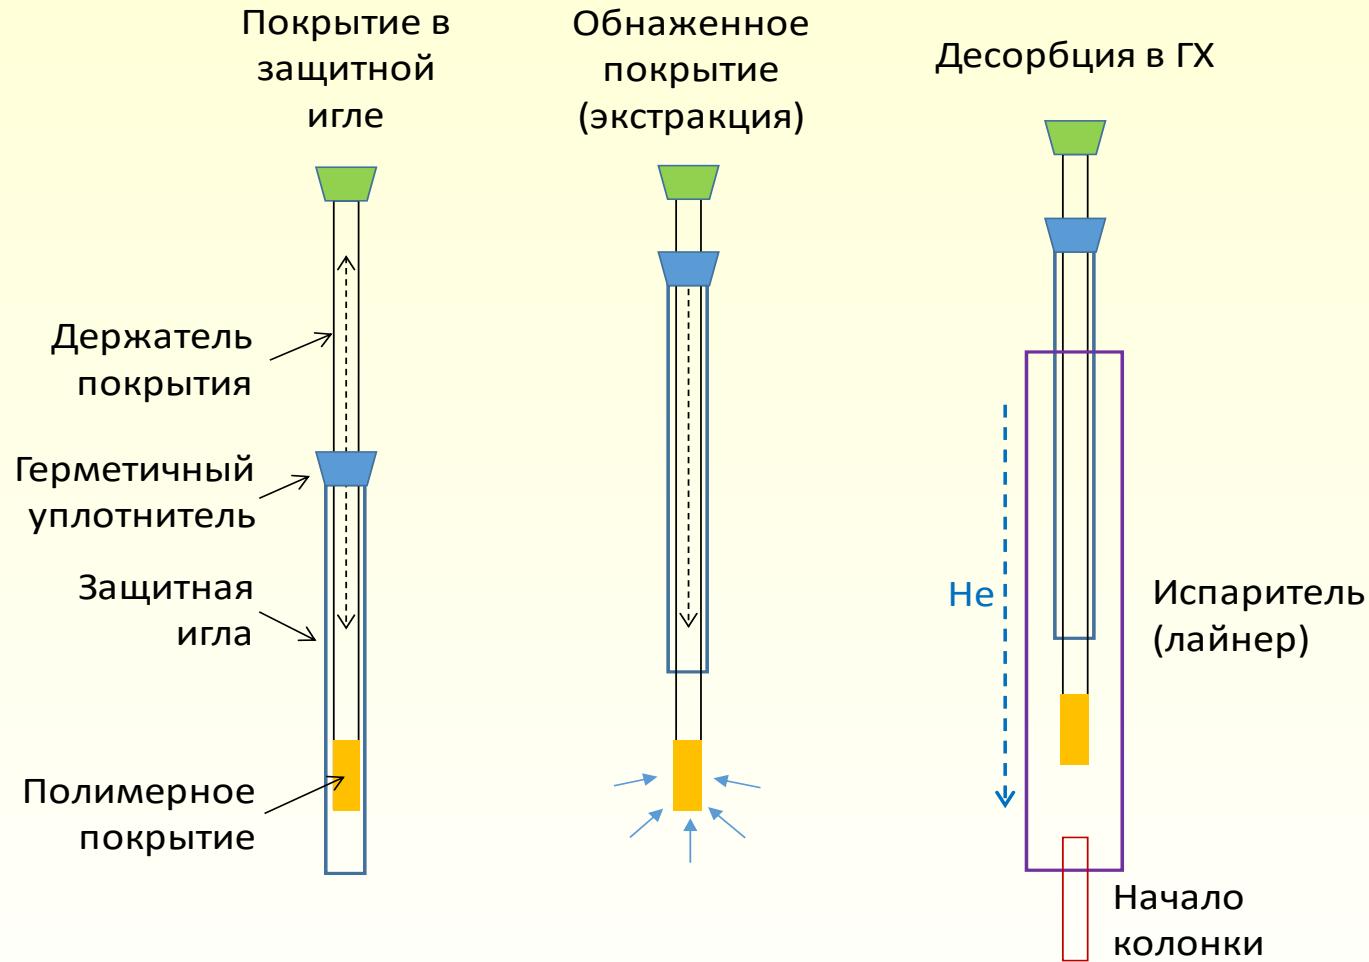

# Purge and trap method

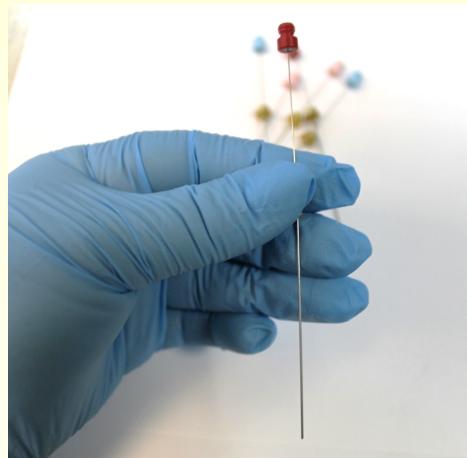

Method of separation of volatile organic compounds from the matrix by gas extraction (inert) over a sample (liquid, solid)

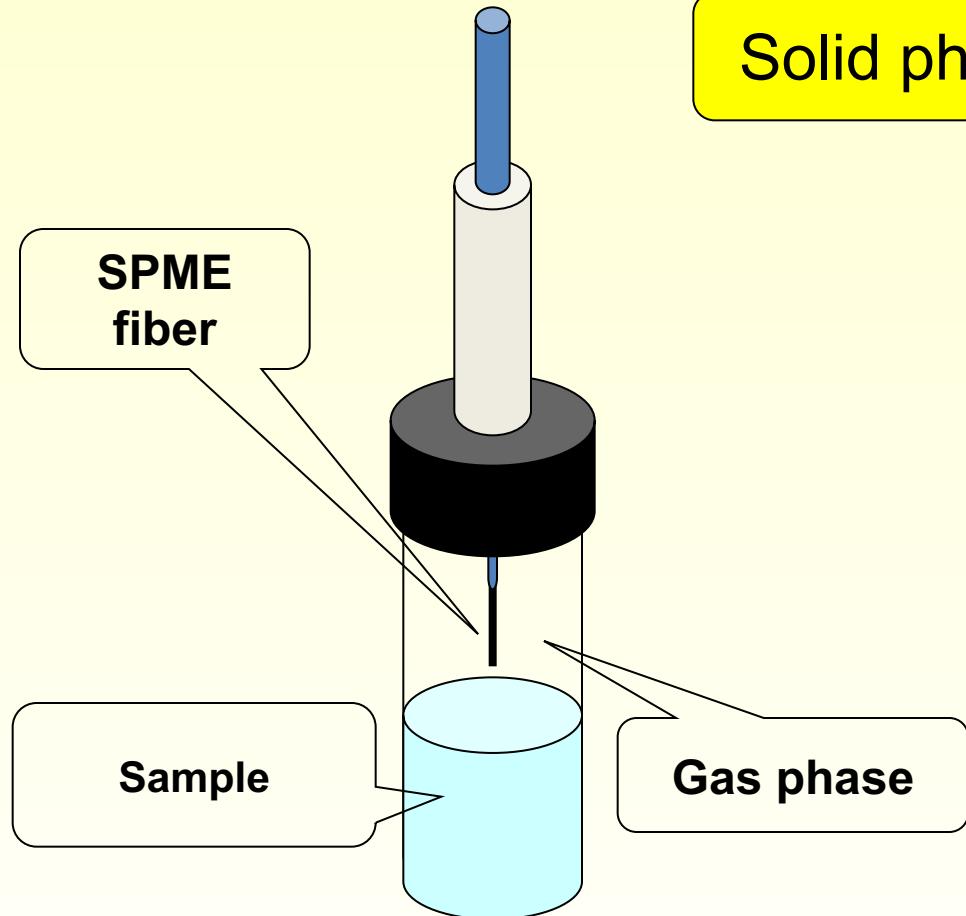

# Solid phase microextraction

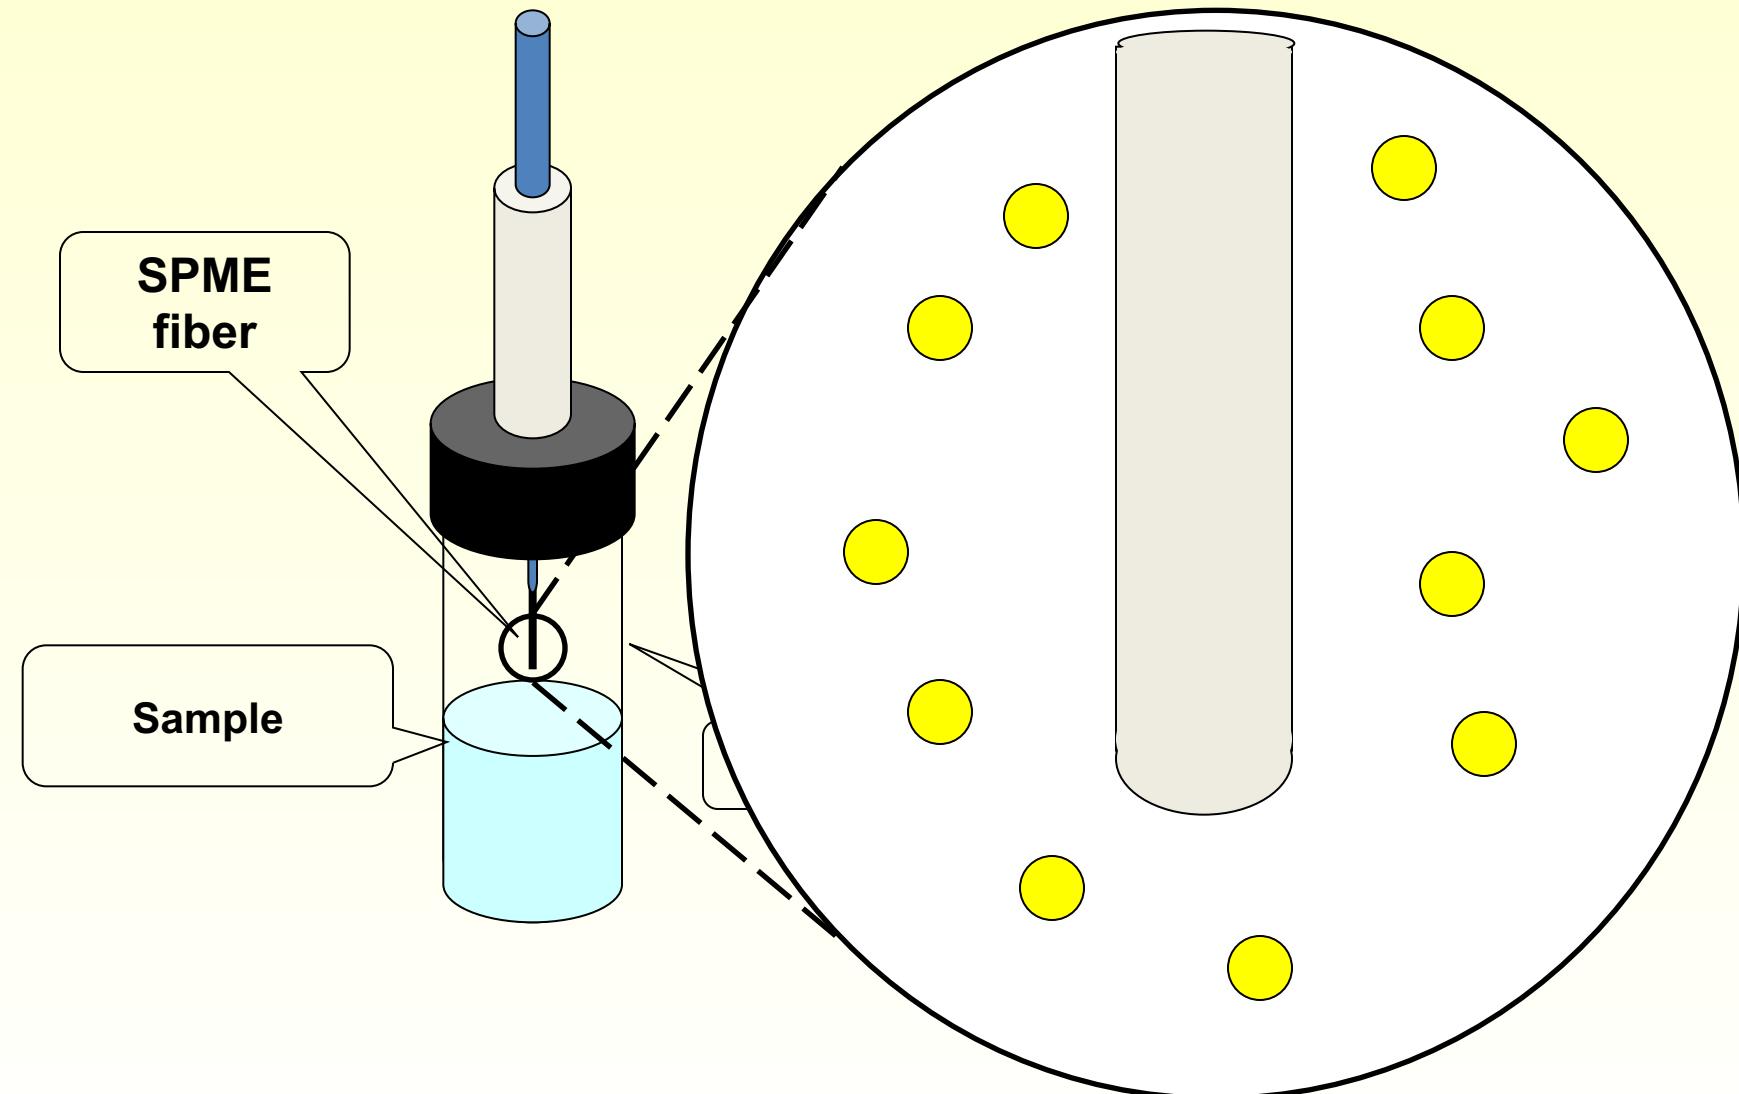

# Solid phase microextraction

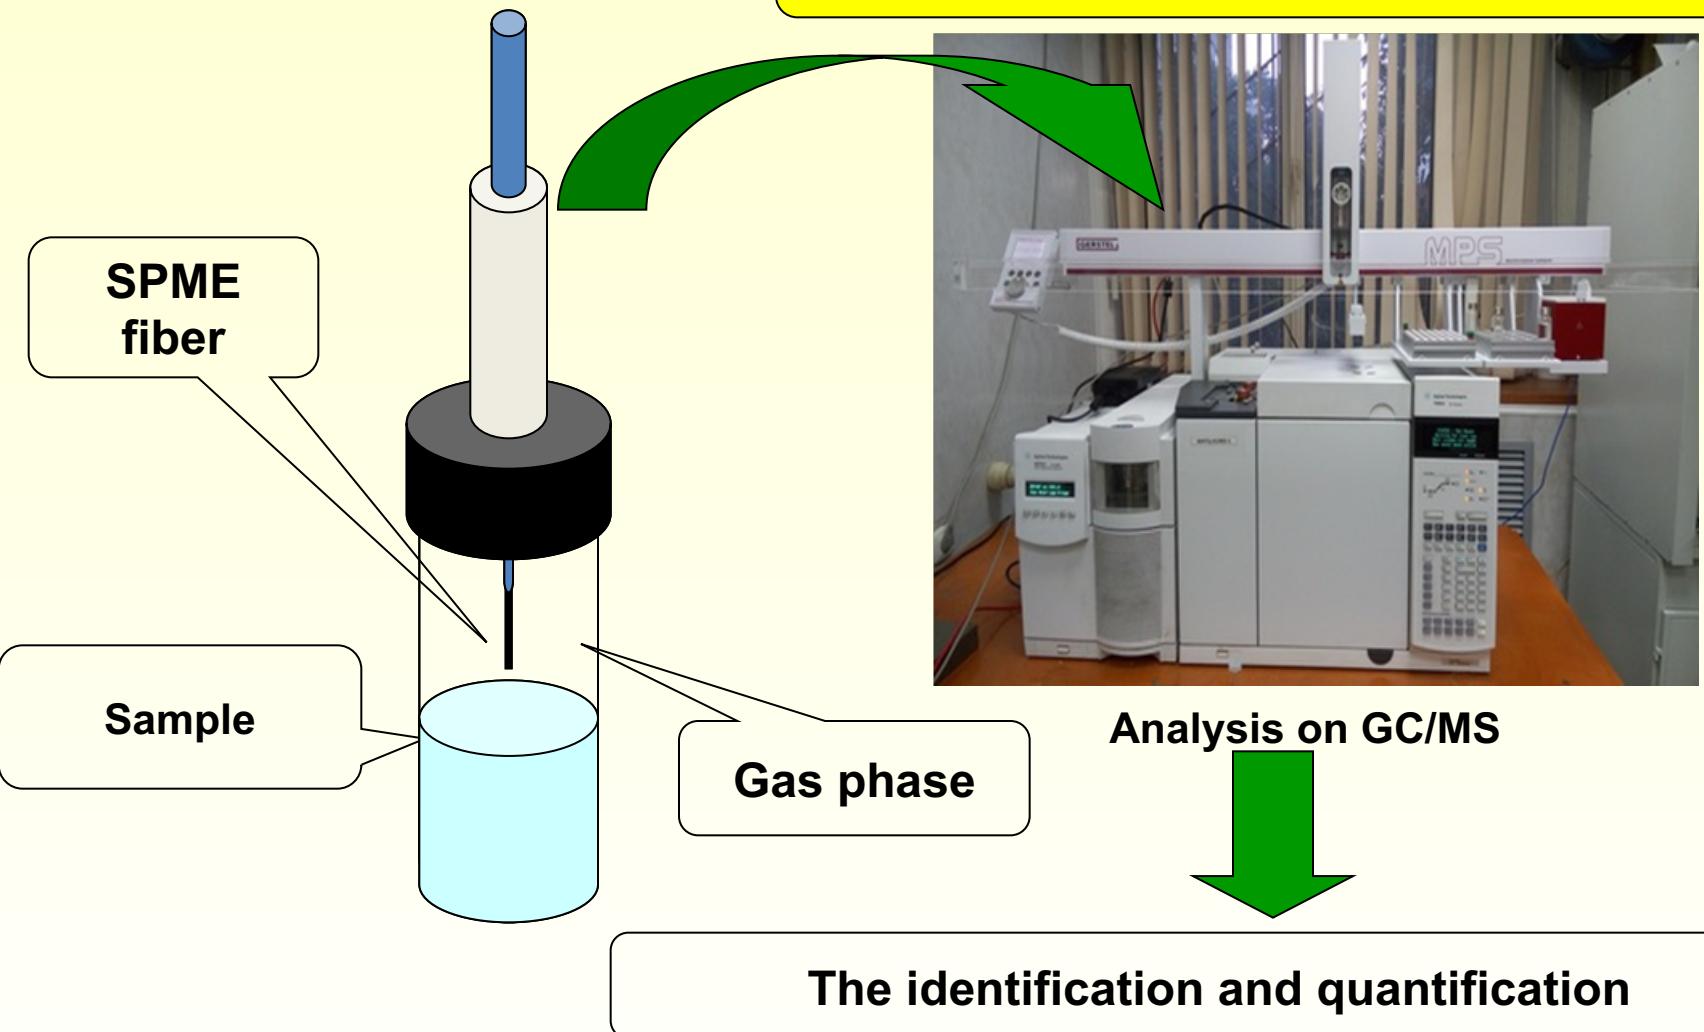

## Solid phase microextraction (SPME)

## Solid phase microextraction (SPME)

# The benefits of SPME

- 😊 Easy to use method;
- 😊 No need for toxic organic solvents;
- 😊 High concentration of non-polar compounds on the micro-coating;
- 😊 High final sensitivity of the method;
- 😊 Fully automated;
- 😊 Simple micro-coating regeneration;
- 😊 Low cost per 1 analysis.

# Disadvantages of SPME

- 😊 The complexity of the calibration.
- 😊 Cost of fibers (\$150 for 1 fiber).
- 😊 Competition between analysts.

Thank you for your  
attention!

# Задачи

- К 1 л раствора  $\text{HNO}_3$  с концентрацией 0,4 моль/л добавили 200 мл воды. Какова концентрация получившегося раствора?

# Задачи

- Образец воды ( $V=50$  мл), содержащий фенол был экстрагирован 10 мл метиленом хлористым. Коэффициент распределения для фенол между водой и метиленом хлористым составил 8,7. Экстракт был проанализирован методом ГХ/МС и концентрация фенола составила 22 мкг/л. Рассчитайте концентрацию фенола в образце воды и степень извлечения фенола из образца воды.

# Задачи

- Образец воды ( $V=50$  мл), содержащий фенол был пропущен через картридж для ТФЭ. Аналит был элюирован 2 мл метиленом хлористым. Степень извлечения составила 100%. К экстракту было добавлено 50 мкл додекана и метилен хлористый был полностью упарен. Концентрация фенола в экстракте составила 230 мкг/л. Рассчитайте концентрацию фенола в образце воды.

# Задачи

- Образец воды ( $V=50$  мл), содержащий фенол был пропущен через картридж для ТФЭ. Аналит был элюирован 2 мл метиленом хлористым. Степень извлечения составила 100%. К экстракту было добавлено 50 мкл бромофенола ( $C=25$  мкг/мл). Анализ экстракта методом ГХ/МС показало соотношение анализа и внутреннего стандарта равной 5,6. Рассчитайте концентрацию фенола в образце воды.
