тей раннего возраста» следующим образом: -это процесс воздействия на детей раннего возраста со стороны родителей с целью достижения желаемых результатов, направленных на успешность формирования личности ребенка.

Изучив дошкольное образование в различных странах, можно сделать вывод, что в странах ОЭСР практикуется два подхода к взаимодействию дошкольного и начального школьного образования. Во Франции и англоязычных странах оно рассматривается, прежде всего, с точки зрения школы и предполагает, что раннее образование должно служить целям общественного воспитания и готовить ребенка к школе, прививая ему соответствующие базовые навыки.

DEPENDENCE ON SOCIAL MEDIA AS A PEDAGOGICAL PROBLEM

Annotation

The article is devoted to the issue date depending on the social networks. Particular attention is paid to their views and negative aspects of social networks. This article is an attempt to reveal the main reasons depending on the social networks.

Key words: social network, social media, pedagogical problem, Kazakhstan

Introduction.

The world evolves and thrives. Each individual has at least a mobile phone. Either, the computer or the laptop, which gives an opportunity to use social networks. As before, if the house was the computer it was intended only for work, and cell phone for communication. Nowadays, all of our free time we spend with these devices. For the one who oversees these processes, it may seem funny. The question arises, what could be so interesting, so what makes you delve into your mobile phone. And the main reason for this behavior is the social network.

In 1995, Randy Conrads invented the first social network. He invented the social network «Classmates» and «Classmate». The main purpose of the website to give the opportunity to find classmates and friends from one school. Today, the site continues its work. Worldwide the site are 50 million people. Later, in 1997-1999 – s, there are other networks as «Diaspora», «MiGente», «BlackPlanet», «Livejournal». And in 2004, Mark Zuckerberg founded the social network «Facebook». In 2008, this social network was the most popular worldwide and holds leading positions until today. In 2006, Jack Dorsey invented the network «Twitter». And it also occupies a leading position. A unique feature of this network is that you can write messages consisting of only 140 characters. Since 2010 there is an opportunity to watch videos, photos. For now, Twitter is in the top ten most viewed sites. Also social network «Instagram» began its work in October 2010. Its peculiarity from other networks that the user has the option shares with different pictures of the world. In the beginning of his work Instagram was opened only for users of the iPhone or iPad, with 2012 got the opportunity and Android users.

Social networks are sites that bring together people with the same interests, hobbies and entertainment. By using these sites, people can share information and find friends. In addition, the website provides an opportunity not only to communicate but

also to view the photos, videos and listen to music. Despite the fact that we are registered on these websites independently, without anyone's help, our every action, that is, with whom we made friends with whom he corresponded – everything is saved. Even our IP address. All this is in the power observers sites.

They can view at any time and used in the required order. In short, if you get in their eyes, they can open the archive and get the right information.

Today social networks have become an integral part of the Internet users. Still very popular among students, young boys and girls. It is worth considering that just as a coin has two sides, there is negative influence of social networks.

Nowadays social networks have become the main entertainment of the youth. Increase the number of consumers who connect, as they say «anytime, anywhere», live in the virtual world. In short, lost the meaning of friendship. There are new opportunities to communicate in social networks, and accordingly, a growing number of interested in the different innovation networks. A lot of people that do not have in real life a single friend, have a thousand friends in the network. Most people this from happening not even in the slightest. On the contrary, cease to maintain relationships with friends, delving more and more into the virtual world unfamiliar friends, where they receive generous compliments and grows more confidence in their own irresistibility. Remains of the opinion that they forgot how to communicate in the real world.

Main body

According to research holding «ROMIR» 93 percent of consumers visiting the Internet because of social networking. And 42 percent after the news. Be men sit less than the representatives of the weaker sex. The most popular network is «In contact». Research ROMIR from 1000 users 79 percent use this website. Another fact that should be noted, the students are also actively using the network. Especially, adolescents. For example, «Vkontakte» in the 11 month use million and in one minute, at the same time 2 million users.

According to the newspaper «Astana Aksham» in Kazakhstan 5.6 million people use social networks daily. The most popular sites include «My world», which is visited by 1 million 125 thousand times, «Classmates» 558 thousand times, «In contact» 252 thousand times, and «Facebook» 410 thousand Time. It turns out, every second user in the network makes itself the wrong information. Frankly, out of which 29% hide name and age, 23% marital status, 22% of the way and Hobbies, 17% education and provide false information about their work.

Speaking, there are even those who learn and create families through the sites, or Vice versa, destroyed their families. Social networks are the cause of every third divorce. According to scientists, young families, conflicts arise because of social networks that lead to divorce.

Social networks are the main thieves of time. The reliance on social networks so much that they don't even notice how the minutes, and then hours. Social network helpful or harmful? Want now to stop on this. It seems that the social network is turning into one of the types of the disease. For the purpose, to avoid being disturbed,

young people in major sits at night in the networks. Because of this day are in a lethargic state. Not getting enough sleep, broken mode. Not enough time to eat in a timely manner, and focus on personal hygiene. If not go to the network of one day, are in this state, as if behind the times, from the main news of the world, even feel myself as disabled. Undoubtedly, many people know that the cell mobile phone harmful if you abuse it. Knowing this, very few refused to use it. On the contrary, with each passing day increases the number of Internet consumers.

Unfortunately, the internet is a great opportunity for attackers. In this regard, many who visit the sites with a bad intention. To catch them or prevent their action is no easy task. It is unclear what purpose open a page with a false name and trying to talk to someone. Those who want to spread false information using social network from anywhere in the world. To hide themselves by registering an assumed name, breaking other people's passwords carry out their plans.

Different aspects of this problem is comparatively examine teacher-psychologists since ancient times. More precisely, the psychologist T. O. Tikhomirov and his followers O. N. Arestev, L. N. Babanin, J. D. Babaeva, A. E. Voiskounsky and many other scientists have studied human interaction, in particular of a teenager with the Internet, mental activity and functional changes are still being researched. Thus, teacher-psychologists O. N. Cheremisina, B. L. Bardier, F. Y. Fomicheva, A. G. Shmelev in his articles indicate that the time spent online – effect on the psyche, behavior and thereby develop psychopathological symptoms, as a dependency, which is accompanied by a lack of opportunities to spend leisure time outside Internet URLs, deception, before other people.

Consider the symptoms depending on the social networks

- Causeless to check my email all the time
- Without the need to go to the Internet
- The prosecution of folks that constantly signal in front of the computer
- Excellence communication on the Internet
- Loss of time measurement
- Eating disorders, communication
- To deny the existence of dependence
- Aggression, apathy, the lack of mood, symptoms of fatigue.

Polish writer Janusz Wisnewski in his novel «Loneliness in the net» says: «the internet brings people. This is a collection of lonely people. It seems that we are all together. But, all alone.» Very many cases of young people in order to find your soul mate, to meet with strangers, and make very big mistakes. Each year, approximately 100 people are killed because of the letters that leave the network. Recently, in one of the information portals, published research about social networks. It says that «Instagram» is a network that makes you depressed. And «Vkontakte», according to scientists, is suicidal site. You can say that in our country, where the suicide rate among adolescents has leading positions, this network has its own powers.

It is impossible to convey the harm to adolescents. The child stops to look for information, try getting used to ready information. May be called a large social problem – dependence on social networks, so as to perform specified in the school's homework, the development of speech, thinking and memory is limited to the site. Dependence on social networks is found in 95 per cent of young people who do not part with mobile phone during study, sleep, food and even leisure activities. As well as losing feelings such as communication, friendship, compassion, caring. To resolve and prevent this global problem, every parent should protect the behavior of children and to pay more attention.

Conclusion

As practice shows, a lot of people try to portray themselves as modest, cultured man, but in real life, unfortunately it is quite contrary. Thus, I want to note that it is not always possible to understand a person in social life. Dependence on social networks is a social problem. As a user of a social network is a member of the society. Social networks are making their impact on all the events taking place in society. This is a huge force that can radically change the relationship of the person in the family who depends on social networks.

В подростковом возрасте, в период полового созревания, поведение в значительной степени определяется характерными для этого периода жизни реакциями эманципации, группирования со сверстниками, увлечения (хобби), имитации, а также формирующимся сексуальным влечением. Именно эти реакции могут оказаться факторами, способствующими злоупотреблению психоактивными веществами.

Остановимся подробнее на поведенческих реакциях пубертатного периода. *Реакция эманципации* проявляется в стремлении высвободиться из-под опеки, контроля, руководства, покровительства со стороны родных, воспитателей, учителей, вообще всех старших по возрасту от установленных ими порядков, правил и законов. Все, что уважается и ценится взрослыми, подростками отвергается.

Реакция увлечения (хобби) в отличие от реакции эманципации, как правило, препятствует аддиктивному поведению. Более того, появление стойких интересов и увлечений способствует резкому сокращению приема спиртных напитков в старшем подростковом и юношеском возрасте. Особенно противодействующим фактором являются интеллектуально-эстетические хобби (увличение литературы, музыки, живописью, историей, философией и т.д.).

Телесно-мануальные хобби (стремление развивать силу, ловкость, достичь высоких спортивных результатов и т.д.) также препятствуют аддиктивному поведению. Однако эти увлечения могут подтолкнуть подростка к злоупотреблению допингами в виде анаболических стероидов или стимуляторов, чтобы добиться максимальных достижений.

Единственное исключение составляет особый вид хобби, называемый *информационно-коммуникативным*. Подростки все время отдают бездумному общению со сверстниками, бесцельному многочасовому путешесвию по интернету, поглощению и обмену малозначимой и не требующей никакой интеллектуальной переработки информации. Отсюда следует тяготение к асоциальному временипрепровождению и таким же компаниям сверстников [2].

Реакция имитации – это стремление подростка копировать поведение, mannerу общаться и одеваться, вкусы и пристрастия людей, к которым он испытывает положительные чувства от уважения до слепого почтания и обожания кумира.

Реакции, обусловленные формирующимся сексуальным влечением, в определенной мере могут влиять на выбор психоактивных веществ и даже способствовать злоупотреблению ими.

Реакция группирования со сверстниками. Группа сверстников для подростка служит, во-первых, важным каналом информации, которую он не может получить от взрослых; во-вторых, новой формой межличностных отношений, в которой подросток познает окружающих и самого себя; в-третьих, группа представляет новый вид эмоциональных контактов, невозможных в семье. Реакция группирования со
