## Chronic Kidney Disease - MBD and Hypertension

1	Comparison of kidney function markers in neonates
	Low birth weight as a predictor of arterial hypertension and chronic kidney disease
2	Obstructive uropathy in children as an etiology for Chronic Kidney Disease (CKD)
	Prevalence of hypertension in neonates: a study in two tertiary care hospitals of Bangladesh
3	A case of abcd (abnormal calcium/calcinosis/creatinine in down syndrome) syndrome
	Utility of telemedicine in care of children with chronic renal diseases- an experience from India
4	Shear wave elastography for predicting renal fibrosis in children
	Effects of $\text{tnf-}\alpha$ , $\text{il-1}\beta$ , and $\text{il-2}$ on regulatory t cells in children with idiopathic nephrotic syndrome
5	Fibroblast growth factor 23 as a marker of cardiovascular complications in children with chronic kidney disease
	Analysis of risk factors of protein energy wasting in children with chronic kidney disease
6	Longitudinal changes of cardiac function in pediatric chronic kidney disease - results from the korean cohort study for outcomes in patients with pediatric chronic kidney disease (know-ped ckd)
	Growth restriction, but not prematurity, is associated with renal microinflammation in young adults
7	2d ultrasound shear-wave elastography as an imaging biomarker in predicting chronic changes in renal histopathology
	Neonatal jaundice is associated with increased risks of congenital anomalies of the kidney and urinary tract
8	Exploring biomarkers for predicting the progression of chronic kidney diseases in korean children with cakut; insights from the know-ped ckd
9	Protection by perinatal oral sodium thiosulfate administration against offspring hypertension in a rat model of maternal chronic kidney disease
	Association between antenatal prostaglandin synthesis inhibitors and childhood kidney disease
10	Tp53rk in fibroblasts drives the progression of chronic kidney disease by phosphorylating birc5
	Outcomes of pediatric end stage renal disease patients with moderate to severe covid-19 infection who underwent hemodialysis with hemoperfusion in a tertiary subspecialty hospital in metro manila: a retrospective single center study
11	Capillary rarefaction and impaired angiogenesis in the adult rat offspring kidney following maternal exposure to ambient particulate matter during gestation and lactation: the role of vitamin d in pregnancy and beyond
	Ambulatory blood pressure abnormalities and obstructive sleep apnea in children with sickle cell disease and their correlation with subclinical target organ damage – a cross sectional study
12	Risk factors associated with recurrent urinary tract infections in children with bladder dysfunction
	Vitamin-d updates
13	The association between children's blood pressure and computer gaming
	Ophthalmic problems in children with renal anomalies and chronic kidney disease
14	Non-invasive detection of early diabetic kidney disease in type 1 diabetes: a focus on intrarenal resistive index and kidney volume
	Incidence and the risk factors of acute kidney disease in hospitalized children in thailand
15	Association between renal stone and systemic blood pressure in children and adolescents
	Incidence of adverse clinical outcome during chronic kidney disease progression: data from the know-ped ckd study
16	Clinical signs, causes, and risk factors of pediatric chronic kidney diseases: a hospital-based case-control study
	Prevalence of obsessive-compulsive disorder in pediatric and adolescent patients with chronic kidney disease
17	Congenital anomalies of kidney and upper urinary tract in children with congenital hypothyroidism; a case-control study
	Neuropilin 1 promotes unilateral ureteral obstruction-induced renal fibrosis via rack1 in renal tubular epithelial cells
18	Impact of the covid-19 pandemic on the care of children with chronic kidney disease in a tertiary government hospital in the philippines
	Automatic screening of pediatric renal ultrasound abnormalities through deep learning and transfer learning
19	User-friendly web-based application: initial steps for calculating calories and protein intake, and providing food recommendations for children with chronic kidney disease.
	The establishment of an operating system and artificial intelligence module to screen pediatric renal ultrasound abnormalities
20	Highly probable pulmonary calcinosis associated with Alport syndrome: the first case reported in the pediatric population

21	Analysis of quality of life among children with chronic kidney disease - an observational study using pediatric quality of life inventory 4.0
	Changes in egfr in children with ckd under two years of age: some cases exhibit a decline in egfr from an early stage.
22	Kimura disease with onset in the form of nephrotic syndrome: one pediatric case and literature review
	Efficacy and safety of dapagliflozin in children with kidney disease: a retrospective study
23	A case of kikuchi-fujimoto disease associated with lupus nephritis in a 10-year-old boy
	Screening for urinary tract infection among school children in Dhaka city and downtown.
24	Ambulatory Blood Pressure Monitoring (ABPM) and Pediatric CKD
	Social Determinants of Health and Quality of Life of Children and Families with Chronic Kidney Disease: Insights from Saudi Arabia
25	Renovascular hypertension secondary to childhood Takayasu Arteritis: A Case Series.
26	Unveiling Schimke Immuno-Osseous Dysplasia: A Case Report of Disproportionate Short Stature with Renal Dysfunction
	Assessment of the quality of life for the caregivers of pediatric patients with chronic kidney disease in a tertiary health care facility
27	Clinical phenotype of focal segmental glomerular sclerosis and chronic kidney disease in monozygotic twins
	Multidisciplinary Approach to Assessment and Management of Children with Fabry Disease: a multicenter prospective cohort study in China.
28	Clinical significance of specific antibodies in idiopathic membranous nephropathy in children
	Mechanism of LAGE3 involved in Galloway-Mowat syndrome.
29	Analysis of clinical data from a single center for novel coronavirus infection in children with chronic kidney disease during the COVID-19 pandemic in December 2022
30	Machine Learning for Accurate Prediction of High-grade Vesicoureteral Reflux in Children with Febrile Urinary Tract Infection
31	Evaluation of kidney damage after pregnancy in women with Alport syndrome
32	Outcomes of single dose rituximab in children with initial episode of nephrotic syndrome: a multicentre, single-arm trial
33	The development of a predictive model for renal injury in pediatric patients with Henoch-Schönlein purpura
34	Cystinosis in a Chinese child with a novel CTNS pathogenic variant-case report
	Establishment of a dual screening strategy for ultrasound and urine in the early postnatal period of natural populations of children
35	IPEX syndrome characterized by IgA nephropathy and inflammatory bowel disease: case report and literature review
	The clinical effect of Rituximab sequential Mycophenolate on Nephrotic Syndrome in children was retrospectively analyzed
36	Overexpression of long noncoding RNA 4933425B07Rik leads to renal hypoplasia by inactivating Wnt/ $\beta$ -catenin signaling pathway
	Maternal vitamin D deficiency activated Gdnf-Ret-pErk1/2 axis caused an increase in congenital renal and urinary tract malformations in mice
37	Cell-cell interactions reveals the mechanisms underlying cystogenesis in NPHP1
38	Comparison of B-cell depletion and recurrence rates in children with frequency-relapsing/hormone-dependent nephrotic syndrome treated with different rituximab regimens
	The Relationship between Socioeconomic Status, Medical Accessibility, Hope and Psychological Resilience of Caregivers of Children with Chronic Kidney Disease in China: Structural Equation Model
39	The molecular mechanism of macrophage infiltration in diabetic nephropathy induced by ANGPTL3 via macrophage scavenger receptor 1
40	Xanthohumol exerts protective function via Crb2 to improve ADR-induced podocyte injury through AMPK/mTOR mediated autophagy pathway

## Comparison of kidney function markers in neonates

**Nodira Murtalibova, National children's Medical Center, USA**

A prematurely born infant is at risk for developing kidney disease at an older age due to the small number of mature nephrons at birth. The negative effects of hypoxia, hemodynamic instability, and the use of nephrotoxic drugs increase the risk of impaired glomerular and tubular functions of the kidneys. Measuring mean kidney volume (MKV) and measuring serum cystatin C can be early indicators of impaired renal function.

**Objectives:** measure size, volume on ultrasound and serum markers of the kidney function in young children born prematurely.

**Methods:** 37 children from 4 to 7 y.o, born prematurely checked in OPD. All children underwent measurement of blood pressure, urinalysis, serum creatinine and cystatin C levels, as well as measurements of the size and MKV by ultrasound.

**Results:** The average age of children was  $5.8 \pm 1.2$  years. Assessing blood pressure for height, 35.1% (13) of children had a blood pressure within the 90th percentile, 3/37 (8%) had pre-hypertension, 5/37 (13.5%) had the first stage of HTN, in 20 (54%) children. The average kidney volume was  $34.86 \pm 8.64$  ml, with a decrease in children born at 28-33 weeks of gestation ( $p=0.05$ ). At the same time, the size of the kidneys in all children was within the normal range according to age. Mean level of cystatin C was  $0.8 \pm 0.6$  mg/l, higher rates was correlated with HTN and with reduced MKV ( $p=0.8$  and  $p=0.002$ ). An increase in cystatin C above 1.0 mg/l has a strong correlation with a reduced MKV ( $\leq 32 \pm 2.84$  ml,  $p=0.02$ ).

**Conclusion:** Children born prematurely are at risk for the development of HTN. MKV is an earlier screening kidney parameter, than size. Elevated cystatin C correlated with earlier GA and with reduced MKV. These indicators can serve as early markers for determining the risk of developing kidney disease in children born prematurely.

## Low birth weight as a predictor of arterial hypertension and chronic kidney disease

**Altynay Balmukhanova, Al-Farabi Kazakh National University, Kazakhstan**

**Introduction.** Arterial hypertension (HTN) presents a significant worldwide medical and social challenge, owing to its widespread prevalence and its association with increased morbidity and mortality due to cardiovascular complications. There is a hypothesis of fetal programming: low birth weight (LBW), resulting from intrauterine growth retardation or prematurity, can cause high blood pressure (BP) due to a low number of renal glomeruli at birth. Our study aimed to estimate the role of low birth weight as a risk factor for blood pressure and further kidney function.

**Methods.** 788 adolescents were screened for BP and examined. The average age was  $16 \pm 0.2$  years. Those, who had a high BP or LBW, were selected for further investigation according to the following criteria:

1. BP > 140/90 mm.Hg (3-times measurement);
2. Birth weight < 2500 g.

Then they were tested for albuminuria and serum creatinine. Used interventions: measurement of BP with digital automatic BP-monitor «OMRON» (Japan); automatic analysis for albuminuria «Cobas u411» (Germany); test for serum creatinine; estimation of GFR according to Cockrouft-Gault formula.

**Results.** The prevalence of high BP among adolescents is 1.2% which correlates with world data in this age group. The prevalence of LBW among participants is 5% and adolescents with high BP and LBW are 0,1%. Results of laboratory tests and estimation of GFR showed that in the group of high BP 50% have high GFR and 50% - had low GFR. Notably, 100% of them have albuminuria. In the LBW group 66,6% have low GFR and so many have albuminuria.

**Conclusion.** Obtained data made us conclude that low birth weight should be considered as a predictor of HTN and CKD in further life. In this relation, physicians should pay attention to the birth weight of children during a clinical examination and take BP and estimate kidney function regularly.
