

Зертханалық сабақ №10

Тақырыбы: Parrot OS жүйесіндегі Python

1) HTML кодты өзгерту;

The screenshot shows a web browser window displaying the source code of a webpage. The code is HTML, starting with a DOCTYPE declaration and a meta tag for charset=utf-8. It includes a script that defines a function to load a new date and a table with a cell center. The browser's developer tools are open, showing the 'Options' tab for a selected element, which displays various attributes like sport, dport, seq, ack, dataofs, reserved, flags, window, chksum, urgptr, and options. The 'Raw' tab is also visible, showing the raw data of the selected element.

The screenshot shows a Python script for packet manipulation. The script imports netfilterqueue and scapy, and defines a function to process packets. It uses netfilterqueue to capture packets and scapy to modify them. The script is designed to intercept and modify network traffic, specifically targeting the 'Accept-Encoding' header in the request. The script is run in a terminal window, and the output shows the modified packet being sent back to the client.
