

## *Fifteenth Annual Conference*

Hunguest Hotel Sun Resort Herceg Novi, Montenegro, September 2–6, 2013  
<http://www.mrs-serbia.org.rs>

### PROGRAMME & THE BOOK OF ABSTRACTS

Organised by

MATERIALS RESEARCH SOCIETY OF SERBIA

under the auspices of

FEDERATION OF EUROPEAN MATERIALS SOCIETIES (FEMS)

MATERIALS RESEARCH SOCIETY (MRS)

**FIFTEENTH ANNUAL CONFERENCE**

# **YUCOMAT 2013**

Hunguest Hotel Sun Resort Herceg Novi, Montenegro,  
September 2-6, 2013  
<http://www.mrs-serbia.org.rs>

## **Programme and The Book of Abstracts**

Organised by:  
**Materials Research Society of Serbia**

under the auspices of  
**Federation of European Material Societies**  
and  
**Materials Research Society**

P.S.A.31.

**ISOCITRIC ACID PRODUCTION BY *YARROWIA LIPOLYTICA* YEAST**

S.V. Kamzolova, V.A. Samoilenco, R.K. Allayarov, I.G. Morgunov  
G.K. Skryabin Institute of Biochemistry and Physiology of Microorganisms,  
Russian Academy of Sciences, Pushchino, Moscow region, Russia

*Threo*-Ds-isocitric (ICA) is used as a building block for chemical synthesis, as a marker to detect the authenticity citrus juices, as an antistress, antihypoxic and immune active agent. Currently, ICA is isolated from *Sedum spectabile* plant at high price (up to 500 €/g). In this study, we developed the process of microbiological production of ICA from rapeseed oil using *Yarrowia lipolytica* yeast strains. Under optimal conditions *Y. lipolytica* produced up to 70 g/L of ICA with the yield of 80%.

This work was supported by the Ministry of Education and Science of the Russian Federation in the scope of Federal Target Program "Research and development for priority directions of science and technology complex of Russia for 2007–2013" (project no. 14.512.11.0045).

P.S.A.32.

**MECHANOCHEMICAL MODIFICATION OF GLAUCONITE, DIATOMITE AND VERMICULITE TO OBTAIN SORBENTS**

F.Kh. Urakaev<sup>1</sup>, A.B. Assilov<sup>2</sup>, B.D. Balgysheva<sup>2</sup>, G.S. Kuanyshova<sup>2</sup>, V.S. Shevchenko<sup>1</sup>  
<sup>1</sup>Sobolev Institute of Geology and Mineralogy SB RAS, Novosibirsk, Russia,  
<sup>2</sup>al-Farabi Kazakh National University, Almaty, Kazakhstan

Minerals (glaucite, glauconite sand, diatomite, and vermiculite) from different deposits were used as starting materials. Minerals were crushed and homogenized (including sodium dihydrogen phosphate as additives) using a steel or agate one-ball vibratory mill. To obtain a sorbent mixture of mineral and NaH<sub>2</sub>PO<sub>4</sub> at different ratios (1:1, 2:1, 3:1, 4:1, respectively) were subjected to mechanical activation (MA) in a planetary mill Pulverisette 6. MA products were studied by XRD, derivatography, DTA, DSC and IR spectroscopy. Sorption capacity of sorbents studied in static and constant stirring of the model solutions with concentrations of manganese sulfate 60–1000 µg/dm<sup>3</sup>. Increasing the sorption properties of MA samples can be explained by the formation of aqua-phosphate glasses. Aqua-phosphate glasses are new sorption centers in the structure of minerals.

FIFTEENTH ANNUAL CONFERENCE  
YUCOMAT 2013
