Lesson 6 **Finding suitable sources. Combining sources.**

Scopus (Elsevier) Coverage

- Scopus is a large abstract and citation database of peer-reviewed literature with smart tools that track, analyze and visualize research
- Contains 21,500 journals (4,200 full open access) & 113,000 books from 500 publishers plus more than 49 million records – 78% with abstracts; over 5.3 million conference papers; coverage back to 2003
- Some of the journal titles and full-text articles are available from Hinari; return to the [Journal collections A-Z list](#).
- Most of the conference papers will be available directly from Scopus.

This is the default **Scopus (Document search)** page.

© 2016 The Author(s). Background: Maternal and neonatal mortality figures remain unacceptably high worldwide and new approaches are required to address this problem. This paper evaluates the impact on maternal and neonatal mortality of a pregnancy **care** package for rural areas of **developing countries** with portable ultrasound and blood/urine tests. Methods: An observational study was conducted, with intervention and control groups not randomly assigned. Setting: Rural areas of the districts of Senahu, Campur and Carcha, in Alta Verapaz Department (Guatemala). The control group is composed by 747 pregnant women attended by the community facilitator, which is the common practice in rural Guatemala. The intervention group is composed by 762 pregnant women attended under the innovative Healthy Pregnancy project. That project strengthens the local **prenatal care** program, providing local nurses training, portable ultrasound equipment and blood and urine tests. The information of each pregnancy is registered in a medical exchange tool, and is later reviewed by a gynecology specialist to ensure a correct diagnosis and improve nurses training. Results: No maternal deaths were reported within the intervention group, versus five cases in the control group. Regarding neonatal deaths, official data revealed a 64 % reduction for neonatal mortality. A 37 % prevalence of anemia was detected. Non-urgent referral was recommended to 70 pregnancies, being fetal malpresentation the main reported cause. Conclusion: Impact data on maternal mortality (reduction to zero) and neonatal mortality (NMR was reduced to 36 %) are encouraging, although we are aware of the limitations of the study related to possible biasing and the small sample size. The major reduction of maternal and neonatal mortality provides promising prospects for these low-cost diagnostic procedures, which allow to provide high quality **prenatal care** in isolated rural communities of **developing countries**. Trial registration: This research was not registered because it is an observational study where the assignment of the medical intervention was not at the discretion of the investigators.
